HTML

1. Title does not give any description about the website's purpose.
2. Meta tag does not have any detail or keywords to help search engines to find the website.
3. Also the meta tag does not include character encoding, in order for the browser to know which character set to use.
4. The classes do not include information about their content. Without details, it is not practical for you or others when using this code.
5. It is a bad practice to include style in HTML.
6. If the image is important in the content, it should have an alt attribute to describe what the image is about, in case that the user is offline. It also makes it more accessible.
7. Title and paragraph share same ID. It makes the code not reusable.
8. It is missing some elements like article if the intention is to contain a composition such a blog or news.
9. A footer is also missing as a standard structure of an HTML.
10. It is not optimized to be accessible for users with disabilities.

CSS

1. There is no harmony between the elements and colors.
2. Chosen colors are psychologically too stressful, contrary to the pictures.
3. White text is difficult to read, it blends with the colors of the image.
4. Text and background are the same color.
5. Font size not adapted to mobile.
6. The main title should have a different weight in order to differentiate what is priority.
7. Subtitle bigger font weight than main.
8. Needs more information for the user to understand what the website is about.
9. The red container gets more eye attention that the main content.
10. Margins are offset. It is more noticeable when using a different device.
11. The website is not accessible for every screen. Definitely, not mobile friendly.
12. Because of the button's position, it makes the red container look as if it has a different padding on the bottom.
